                                                                                                                                                                                                                                     The invention relates to the discovery of protein-protein interactions that are involved in the pathogenesis of neurodegenerative disorders, including Alzheimer's disease (AD). The invention is also directed to protein complexes involved in neurodegenerative disorders. The protein complexes are useful for diagnosing the presence of or a predisposition to neurodegenerative disorders (e.g. Huntington's disease, Parkinson's disease, dementia and Alzheimer's disease). They are also useful in drug screening. The invention is used in protein therapy. The present sequence is PN7740 protein. This sequence is used in the exemplification of the

The present sequence is the protein sequence of a novel human

thosphatase, designated PN7740. The sequence is predicted from a human

thosphatase, designated PN7740. The sequence is predicted from a human

the frain cDNA clore dentified in a yeast two-hyprid screening using as bait

a fragment of Fe65 protein (amino acids 360-552, i.e. the first

conain showed PN7740 to be a novel phosphatase that binds to the first

the free protein binding domain (PTB)). Identification of a phosphatase 2C

conains showed PN7740 to be a novel phosphatase that binds to the first

the protein proteins (amino of this interaction may influence

amyloid beta protein precursor metabolism. The invention provides protein

complexes, identifieded by yeast two-hybrid screening, that complexes,

interacting proteins (or fragments), antibodies to the complexes,

complexes, identifieded by the disorders (including diagnosis of a

interacting proteins (or existence of, the disorder), drug screening for

adents which modulate the protein interaction, and identification of

conditional proteins in the pathway common to the interacting proteins. A

conditional proteins in the pathway common to the interacting proteins. A

conditional proteins in the pathway common to the interacting proteins. A

conditional proteins in the pathway common to the interacting proteins. A

conditional proteins. Parkinson's disease, parkinson's disease, parkinson's disease.

Colaimed method for treating a neurodegenerative disorder selected from

Colaimed method for treating and an antibody, or is a

compound that modulates expression of one of the proteins, or a nucleic acid encoding such an antibody, or is a

compound that modulates expression of one of the proteins, or is a

compound that modulates expression of one of the proteins, or a nucleic acid encoding set to a nucleic acid

compound the proteins, or a compound or ribozyme which hybridises to a nucleic acid

compound the proteins, or a compound is a compound capable of strengthening

The invention discloses a method for modulating in a cell, a protein complex having a first protein, which is CIB (calcium-binding protein), intraracting with a second protein, which is mixed lineage kinase (MEX), or the interaction of MEX2 with the ligand, which comprises administering to the cell a compound capable of modulating the protein complex or the interaction, or a peptide capable of interfering with the protein's interaction. The peptide is associated with a transporter capable of increasing cellular uptake of the peptide. The method is useful for modulating neuronal death in a patient having a neurodegenerative disorder such as Huntington's disease, administration and Alzheimer's disease. The technique used to discover additional proteins that interact with the major Alzheimer's disease proteins (including APP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Yeast two-hybrid; PN7740; human; CIB; calcium-binding protein; MLK2; mixed lineage Kinase 2; ligand; transporter; cellular uptake; neuronal death; neurodegenerative disorder; Huntington's disease; Parkinson's disease; dementia; Alzheimer's disease; APP; presenilin; PS1; PS2; Abeta; trophic; sAPP; metabolite; Pe65.

                                                                                                                                                                                                                                                                                                                                                                09
                                                                                                                                                                                                                                                                                                                                                                                                 9
                           been shown to interact with the presentlins, PS1 and PS2, but due to the casual role of mutations of these presentlins in Alzheimer's disease, other proteins, like MLK2, are likely to play a major role in the pathogenesis. APP metabolism is also a critical event in Alzheimer's disease pathogenesis as it leads to the release of either toxic (Abeta) or trophic (APPP) metabolites. Fe65 (not defined) has been shown to interact with APP and peptides interacting with Fe65 may also be useful in treating neurodegenerative disorders. The compound may capable of strengthening the interaction between the first and the second protein. The sequence presented is the human PN7740 protein which was isolated duto its interaction with Fe65 found using the yeast two-hybrid system
                                                                                                                                                                                                                                                                                                                                                                                            1 MSTAALITLVRSGGNQVRRVLLSSRLLQDDRRVTPTCHSSTSEPRCSRFDPDGSGSPAT

The invention relates to the discovery of protein-protein interactions that are involved in the pathogenesis of neurodegenerative disorders including Alzheimer's disease (AD). The invention is also directed to protein complex comprising two proteins selected from a complex of calcium binding protein (CIB) and mixed lineage kinase 2 (WLKZ). AD interacting proteins recuested is new targets for the identification of useful pharmaceuticals, new targets for diagnostic tools in the identification of individuals at risk, sequences for producing protein carrantomed cell lines, cellular models and animal models and new bases for therapeutic intervention in neurodegenerative disorders, including. Modulators of the protein complex are useful for treating ementing. Parkinson's disease and AD. The present sequence is PN7740 protein. This sequence used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       301 NFMVNSQEICDFVNQCHDPNEAAHAVTEQAIQYGTEDNSTAVVVPFGAWGKYKNSEINFS

The invention and states a mechanic to modurating in a creat, a protein and complex having a first protein, which is Mint2, interacting with a second protein, which is PDE-9A, or the interaction of PDE-9A with the ligand, or protein, which is PDE-9A, or the interaction of PDE-9A with the ligand, computed capable of modulating the protein complex or the interaction, or a peptide capable of interfering with the protein's interactions. The peptide is associated with a transporter capable of increasing cellular uptake of the peptide. The method is useful for modulating neuronal death in a patient having a neurodegenerative disorder such as Huntington's disease, Parkinson's disease, dementia and Alzheimer's disease. The technique used to discover additional proteins that interact with the major Alzheimer's disease proteins (including APP, not defined, and presentilins) was the yeast two-hybrid system. Mint2 has been shown to interact with APP, and due its interaction with presentilins and KIPAO47 it is likely to play a major or critical event in Alzheimer's disease. APP metabolism is also critical event in Alzheimer's disease. APP metabolism is also critical event in Alzheimer's disease pathogenesis as it leads to the critical event in Alzheimer's disease pathogenesis as it leads to the defined) has been shown to interact with APP and peptides interacting with Fe65 may also be useful in treating neurodegenerative disorders. The compound may capable of strendghening the interaction with Fe65 found using the yeast two-hybrid system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

presentlins) was the yeast two-hybrid system. CIB has been shown to intersact with the presentlins, PS1 and PS2, but due to the casual role of mutations of these presentlins in Alzheimer's disease, other proteins, like MLK2, are likely to play a major role in the pathogenesis. APP metabolism is also a critical event in Alzheimer's disease pathogenesis as it leads to the release of either toxic (Abbeta) or trophic (SAPP) metabolites. Fe65 (not defined) has been shown to interact with APP and peptides interacting with Fe65 may also be useful in treating neurodegenerative disorders. The sequence presented is the human PN7740 protein which was isolated due to its interaction with Fe65 found using

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                                    The invention relates to human protein phosphatase IIC ABI2 polypeptides and polynucleotides. The polypeptides can be expressed by standard recombinant methodology. The polypeptides, polynucleotides and modulators recombinant methodology. The polypeptides, polynucleotides and modulators disease or treating a disease which include asthma, chronic obstructive pulmonary disease (COPD), peripheral or central nervous system disease. Including neurodegenerative disease, a disorder associated with an increase in apoptosis, including AIDS and other infectious or genetic immunodeficiency, myelodysplasia, ischemic injury, toxin-induced disease, with decrease in apoptosis, including cancer and inflammatory disorder. Fusion proteins comprising protein phosphatase IIC ABI2 are useful for generating antibodies and for use in various assay systems, and the protein in a two-hybrid assay or three-hybrid assay. The present sequence represents a human protein phosphatase IIC ABI2 polypeptide

that are invention relates to the discovery of protein-protein interactions that are involved in the pathogenesis of neurodegenerative disorders, including Alzheimer's disease (AD). The AD interacting proteins are useful as new targets for the identification of useful pharmaceuticals, new targets for the identification of useful pharmaceuticals, new targets for diagnostic tools in the identification of individuals at risk, sequences for producing transformed cell lines, cellular models and neurodegenerative disorders, particularly AD. The DNA encoding the neurodegenerative disorders, particularly AD. The DNA encoding the protein, or animals which do not express the native gene but express the protein, Modulators of the protein complex are useful for treating a cheurodegenerative disorder including Huntington's disease, Parkinson's disease, dementia or Alzheimer's disease. The present sequence is human protein used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NEWANSQEICDEVNQCHDENBAAHAVTEQAIQYGTEDNSTAVVVPFGAWGKYKNSEINFS 360

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated protein complex having a first protein which is postsynaptic density protein (PSD95) or Fe65 interacting with a second protein which is PN7740. Protein complex of the invention is useful for diagnosing a neurodegenerative disorder in human, for determining a predisposition to the neuro- degenerative disorder of the disorder. They are used for treating degenerative disorders such as Huntington's disease, Parkinson's disease, dementia and Alzheimer's disease. They are also used for drug designing and for screening compounds that modulate the interaction of proteins of the invention. The present sequence is human PN7740 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

```
polymucleotide and polypeptide are useful in the diagnosis, treatment and prevention of immune system disorders, neurological disorders of developmental disorders and call proliferative disorders. Examples of immune system disorders and call proliferative disorders. Examples of immune system disorders include acquired immune deficiency syndrome (AIDS), severe combined immunodeficiency disease (SCID), adult respiratory distress syndrome, allergies, amyloidosis, ansemia, asthma, atheroscierosis, Crohn's disease, approlemental in dispetes mallitus, emphysema, Goodpasture's syndrome, gout, Grave' disease, multiple of sclerosis, myasthenia gravis, myocardial or pericardial inflammation, osteoporosis, pancreatitis, psoriasis, Reiter's syndrome, cretexing attential disorders include Allammation, stlerams, neurological disorders include Allammation, cretexidation and other developmental disorders of central nervous system souch as syndrome, cerebral palsy, parkinson's disease, mental cretardation and other developmental disorders of central nervous system such as systems; such as systemic disorders includie e.g. renal tubular acidosis, puchemne and developmental disorders include e.g. renal tubular acidosis, puchenne and affective disorders include e.g. renal tubular acidosis, puchenne and sevelopmental disorders include e.g. renal tubular acidosis, puchenne and carcer of activity disorders include e.g. actinic keratosis arteriosclerosis, creming an agonist, and propertied and polypoptide and cancer including adenocarcinoma, leukaemia. The polypoptide and polypunclectide are further useful for analysing proteome of a tissue or a cell type, which represents the global pattern of gene expression by a cutting a denacation at analysing a transcript image of a tissue or cell type, which represents the global pattern of gene expression by a cutticular tissue or cell type.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WDNFGIWDNRIDEPILLPPSIKYGKPIPKISLENVGCASQIGKRKENEDRFDFAQLTDEV 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the isolation of a novel human protein the phosphatase designated SGP037, and the polymucleotide sequence encoding tr. The gape encoding human SGP037 maps to chromosome 4421. The SGP037 polypeptide and the polymucleotide sequence encoding it are useful for treating diseases or disorders such as cancers (e.g. cancer of the blood ovarian, bladder or kidney), immune related diseases and disorders, cardiovascular diseases, brain and neuronal-associated diseases (e.g. cardiovascular diseases, brain and neuronal-associated diseases (e.g. cardiovascular diseases, brain and neuronal-associated diseases (e.g. dysfunction, mood disorders, attention disorders, cognition disorders or dyskinesias), metabolic disorders, and inflammatory disorders or thematory districts, chronic inflammatory bowel disease, chronic inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò

regulation of the TAXI signalling pathway, cellular channels, cyclin dependent kinases and the Ras pathway. The methods and compositions of the present invention may be useful during the diagnosis or treatment of a variety of disorders including cancers, immune-related and cardiovascular disease, brain or neuronal-associated diseases such as sexual dysfunction and migraine, psychotic and neurological disorders e.g. schizophrenia and metabolic disorders such as obesity. Furthermore, ocular disease, such as glaucoma and inflammatory disorders e.g. multiple sclerosis may be addressed, as well as viral infections caused by HIV and other pathological agents. Finally, the molecules of the invention may be utilised in the production of transgenic animals and during gene therapy. The current sequence is that of the human serine/threonine PP2C phosphatase \$GF037 protein of the invention

New phosphatase nucleic acid molecule and polypeptide, useful for diagnosing or treating phosphates-related disorders such as cancers, immune-related disorders, cardiovascular disease, and inflammatory disorders

Claim 26; Fig 2; 152pp; English.

The invention relates to a novel isolated nucleic acid molecule encoding a serine/threonine phosphatase (STP) polypeptide which is a member of the PP2C family. PP2C phosphatases are involved in a number of cellular processes including modulation of integrin signal transduction and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      360
                                                                                                                                                               The invention relates to a method of screening drug candidates for modulating interaction of proteins in a complex. The method is useful for soreening drug candidates useful in treating neurodegenerative disorder, by measuring the activity of a protein selected from Mint2 and PDE-9A in the presence or absence of the drug, and comparing the activity measured, where if there is a difference in activity, then the drug is a drug candidate for treating the neurodegenerative disorder. The neurodegenerative disorder is Huntington's disease, Parkinson's disease, dementia, or Albheimer's disease, preferably Albheimer's disease. The drug, modulator or compound identified by the methods of the invention are useful for treating a neurodegenerative disorder. The present sequence represents the amino acid sequence of human PN7740.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              301 NFMVNSQEICDFVNQCHDPNEAAHAVTEQAIQYGTEDNSTAVVVPFGAWGKYKNSEINFS 360

The invention describes screening a drug in vitro by combining proteins of a protein complex in the presence of a drug to form a first complex; combining the proteins in the absence of the drug to form a second complex; measuring the amount of the two complexes; and comparing the amount of the two complexes; and comparing the amount of the second complex. The method is useful for screening drug candidates capable of modulating the interaction of the proteins of a protein complex, useful for treating a neurodegenerative disorder, e.g. Huntington's Disease, Parkinson's Disease, dementia or Alzheimer's Disease (AD). The inventive method provides for the discovery of additional proteins interacting with various domains of the malor Alzheimer protein. Foreins interacting with various domains of the malor Alzheimer protein; including APP and the presentlins. It can also identify the protein-protein interactions that are involved in Alzheimer's Disease (AD) pathogenesis, and to identify drug targets. This is the amino acid sequence of a novel human protein bait protein bait when the protein and the protein and the protein bait.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           301 NFWYNSQEICDFVNQCHDPNEAAHAVTEQAIQYGTEDNSTAVVVPFGAWGKYKNSEINFS 360

polynucleotides may be used for detection of prostate cancer, chromosome factorion, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, reproductive, disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present

```

```
The invention relates to human protein phosphatase IIC ABI2 polypeptides and polynucleotides. The polypeptides can be expressed by standard recombinant methodology. The polypeptides, polynucleotides and modulators are useful for modulating activity of protein phosphatase IIC ABI2 in a disease or treating a disease which include aschma, chronic obstructive pulmonary disease (COPD), peripheral or central nervous system disease in no protein phosphatase IIC ABI2 in a disease in apoptosis, including AIDS and other infectious or genetic immunodeficiency, myelodysplasia, ischemic injury, toxin-induced disease, with derease, viral infection and osteoporosis, or disorder associated with decrease in apoptosis, including cancer and inflammatory disorder. Fusion proteins comprising protein phosphatase IIC ABI2 are useful for generating antibodies and for use in various assay systems, and the protein phosphatase IIC ABI2 polypeptide can also be used as a bait protein in a two-hybrid assay or three-hybrid assay. The present sequence represents a human protein phosphatase IIC ABI2 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WDNFGIWDNRIDEPILLPPSIKYGKPIPKISLENVGCASQIGKRKENEDRFDFAQLTDEV 120

```

```
New polypeptide for treating a subject having a disorder or at risk of developing a proliferative disorder, cardiovascular disorder, autoimmune or metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a human polypeptide, designated 16105. 16105 polypeptides and polymucleotides are used for evaluating the efficacy of a treatment of cancer or a cellular proliferation and/or differentiation disorder in a subject. They are also useful for diagnosing a cancer or a cellular proliferation and/or differentiation disorder. The cancer or cellular proliferation and/or differentiation disorder in a subject. The cancer or cellular proliferation and/or differentiation is breast, lung, brain or ovarian cancer. They may also

```

```
The invention relates to a method for identifying a compound capable of treating a cardiovascular disorder. The present invention identifies the differential expression of 162, 6159, 6193, 7717, 1439, 29002, 33216, 43726, 69292, 21656, 32427, 2402, 7747, 1720, 9151, 60491, 1371, 7077, 33207, 1449, 18036, 16105, 38650, 14245, 58848, 1870, 25866, 32394, 3484, 2485, 2183, 10532, 18610, 8165, 2448, 2448, 1447, 9792, 12608, 2313, 10532, 18610, 8165, 2448, 2448, 1448, 48237, 8912, 19489, 21833, 2217, 59590, 18992, 2084, 2252, 3474, 9792, 15400, 1452 or 6585 genes in cardiovascular disease states. The methods are useful in chargnosing, preventing and treating cardiovascular disorders such as therosclerosis, cardiac hypertrophy, ischaemia, reperfusion injury, aretrail inflammation, vascular heart disease, occombry microembolism, techycardia, prescular wall remodeling, coronary correstencial inflammation, vascular heart disease, valvular disease, including but not limited to, valvular degeneration caused by calcification, rheumatic heart disease, endocardiis, or complications of artificial valves; arrial fibrillation, long-QT syndrome, congestive cardiomyopathy, myocardial infarction, coronary arrial fibrillation, atrial flutter, pericardial disease, including but not limited to, pericardial effusion and pericardiis; cardiomyopathy, myocardial infarction, coronary arrery disease, coronary arrery spasm, ischaemic disease, arrhythmia, sudden cardiac death and cardiomyopathy, myocardial infarction, coronary arrery disease, coronary arrery spasm, ischaemic disease, arrhythmia, sudden cardiac death and cardiomyopathy, myocardial infarction, coronary arrery disease, coronary arrery spasm, ischaemic disease, arrhythmia, sudden cardiac death and cardiomyopathy, myocardial infarction, coronary arrery disease, coronary arrery spasm, ischaemic disease, arrhythmia, sudden cardiac death and cardiomyopathy compounds that modulate cardiovascular disease.

C given in ADE31644-ADE31769 represent the genes and proteins that may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180

The invention relates to human protein phosphatase IIC ABI2 polypeptides and polynucleotides. The polypeptides can be expressed by standard and polynucleotides and modulators recombinant methodology. The polypeptides, polynucleotides and modulators are useful for modulating activity of protein phosphatase IIC ABI2 in a disease or treating a disease which include asthma, chronic obstructive pulmonary disease (COPD), peripheral or central nervous system disease including neurodegenerative disease, a disorder associated with an increase in apoptosis, including AIDS and other infectious or genetic immunodeficiency, myelodysplasia, ischemic injury, toxin-induced disease, with decrease in apoptosis, including cancer and inflammatory disorder. Fusion proteins comprising protein phosphatase IIC ABI2 are useful for generating antibodies and for use in various assay systems, and the protein phosphatase IIC ABI2 polypeptide assay. The present sequence represents a human protein phosphatase IIC ABI2 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WDNFGIWDNRIDEPILLPPSIKYGKPIPKISLENVGCASQIGKRKENEDRFDFAQLTDEV 120

(first entry)

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity. Claim 20; SEQ ID NO 37075; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCN) primers, ollogomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AEG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in the will be application of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, huntington's disease, amyotrophic thateral socierosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thromolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

Claim 1; Page 27; 33pp; Chinese.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous as system diseases, such as localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral selectoris, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 TKRIKLHHADDSFLVLTTDGINFWYNSQEICDFVNQCHDPNEAAHAVTEQAIQYGTEDNS 120

                                                                                                                                                                             Gaps
                                                                     The present invention relates to novel human secretory or membrane proceins (ADA54071) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.

The invention relates to human protein phosphatase IIC ABI2 polypeptides and polynucleotides. The polypeptides can be expressed by standard recombinant methodology. The polypeptides, polynucleotides and modulators are useful for modulating activity of protein phosphatase IIC ABI2 in a disease or treating a disease which include asthma, chronic obstructive pulmonary disease (COPD), peripheral or central nervous system disease including neurodegenerative disease, a disorder associated with an increase in apoptosis, including AIDS and other infectious or genetic immunodeficiency, myelodysplasia, ischemic injury, toxin-induced disease, with decrease, viral infection and osteoporosis, or disorder associated with decrease in apoptosis, including cancer and inflammatory disorder. Pusion proteins comprising protein phosphatase IIC ABI2 are useful for generating antibodies and for use in various assay systems, and the protein in a two-hybrid assay or three-hybrid assay. The present sequence represents a human protein phosphatase IIC ABI2 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         241

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        22-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-JUL-1999
  The invention relates to human protein phosphatase IIC ABI2 polypeptides and polymucleotides. The polypeptides can be expressed by standard recombinant methodology. The polypeptides, polymucleotides and modulators are useful for modulating activity of protein phosphatase IIC ABI2 in a disease or treating a disease which include asthma, chronic obstructive complements of the polymeral or central nervous system disease including neurodegenerative disease, a disorder associated with an increase in apoptosis, including and other infectious or genetic immunodeficiency, myelodysplasia, ischemic injury, toxin-induced disease, with decrease, viral infection and osteoporosis, or disorder associated with decrease in apoptosis, including cancer and inflammatory disorder. Pusion proteins comprising protein phosphatase IIC ABI2 are useful for generating antibodies and for use in various assay systems, and the protein phosphatase IIC ABI2 polypeptide can also be used as a bait protein in a two-hybrid assay or three-hybrid assay. The present sequence represents a human protein phosphatase IIC ABI2 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                 283 IKLHHADDSFLVLTTDGINFMVNSQEICDFVNQCHDPNEAAHAVTEQAIQYGTEDNSTAV 342

The invention relates to a method for modulating a response in a target plant to abscisic acid (ABA) by introducing a DNA construct comprising an ABA-associated sequence operably linked to an early kernel/embry promoter into the plant. The method also involves modulating ABA perception and signal transduction in developing seeds. The method is used to produce plants, particularly cereal plants such as maize, which have a modified response to ABA so that an increase in yield can be produced. The plants are protected against any harmful/detrimental feetess and adverse environmental conditions. The ABA function is disrupted in a tissue and developmental preferred manner so that female reproductive tissue is insulated from the stress or adverse environmental conditions. Other plants which can be transformed include rice, cotton, citrus trees, conatoes, pines, soybean, peanut and olive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA constructs containing an abscisic acid-associated sequence are used to modulate a response in a plant to abscisic acid so that the plants are protected against any harmful or detrimental effects of stress and environmental conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DFCHTHMEKCIMDLLPKEK------NLETLLTLAFLEIDKAFSSHARLSADATLL 184

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human protein phosphatase IIC ABI2 polypeptides and polymucleotides. The polypeptides can be expressed by standard recombinant methodology. The polypeptides, polymucleotides and modulators are useful for modulating activity of protein phosphatase IIC ABI2 in a disease or treating a disease which include asthma, chronic obstructive computating activity of protein phosphatase IIC ABI2 in a disease or treating a disease which include asthma, chronic obstructive computations and formal nervous system disease including neurodegenerative disease, a disorder associated with an increase in apoptosis, including AIDS and other infectious or genetic immunodeficiency, myelodysplasia, ischemic injury, toxin-induced disease, with decrease in apoptosis, including cateors and inflammatory disorder. Fusion proteins comprising protein phosphatase IIC ABI2 are useful for generating antibodies and for use in various assay systems, and the protein phosphatase IIC ABI2 polypeptide can also be used as a bait protein in a two-hybrid assay or three-hybrid assay. The present sequence of protein identified with Swiss Prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12;

The present invention relates to phosphatase polypeptides, nucleotide sequences encoding them, as well as various products and methods useful for the diagnosis and treatment of various phosphatase related diseases and conditions. Substance that modulates the activity of phosphatase polypeptide is used to treat immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases and metabolic disorders, including cancers of tissues, cancers of hematopoietic origin, diseases of central and peripheral nervous system, alzheimer's disease, Parkinson's disease, multiple sclerosis, amyotrophic laterial sclerosis, viral infections, infections caused by prions, bacteria and fungi, ocular diseases, diabetes, migraines, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders, hypotension, hypertension, psychotic disorders, neurological disorders, cyskinesias and organ transplant rejection. The present amino acid sequence is human SGP039 phosphatase polypeptide. This sequence is classified as serine phosphatase, STP and PP2C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; protein phosphatase 2; PP2; immune system disorder; AIDS; acquired immunodeficiency syndrome; thymic hypoplasia; anaemia; asthma; crohn's disease, neurological disorder; epilepsy; Huntington's disease; dementia; Parkinson's disease; developmental disorder; Down's syndrome; cell proliferative disorder; cancer; adenocarcinoma; leukaemia; lymphoma;

The present invention relates to a new polypeptide, a naturally occurring amnio acid sequence at least 95 % identical to it, a biologically active fragment of it or an immunogenic fragment of it. The polypeptides, polynucleotides, agonists and antagonists are useful for diagnosing, treating or preventing disorders associated with aberrant expression of protein phosphatases (PP) particularly immune system disorders e.g. acquired immunodeficiency syndrome (AIDS), thymic hypoplasia, anaemia, athma or Crohn's disease, neurological disorders e.g. publicpsy, Huntington's disease, dementia or Parkinson's disease, developmental disorders e.g. bown's syndrome, or cell proliferative disorders e.g. cancers including adenocarcinoma, leukaenika, lymphoma, melanoma, myeloma or sarcoma. The present amino acid sequence represents human protein phosphatases 2 (PP2) which is one of several human protein phosphatases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New protein phosphatases, useful for diagnosing, treating or preventing immune system disorders (e.g. Crohn's disease), neurological disorders (e.g. Parkinson's disease), or cell proliferative disorders (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ramkumar J, Yao MG, Burford N, Wang YE;

They are also useful for diagnosing a cancer or a cellular proliferation and/or differentiation disorder in a subject. The cancer or cellular proliferation and/or differentiation is breast, lung, brain or ovarian cancer. They may also be used for treating proliferative disorders e.g., cancer; cardiovascular disorders e.g., hyperension, atherosolerosis, arrhythmias, heart failure; endothelial cell disorders e.g., psoriasis, Grave's disease, autoimmune diseases e.g., diabetes mellitus, Crohn's disease; viral diseases; pain; or metabolic disorders.

The invention relates to human protein phosphatase IIC ABI2 polypeptides and polymucleotides. The polypeptides can be expressed by standard recombinant methodology. The polypeptides, polymucleotides and modulators are useful for modulating activity of protein phosphatase IIC ABI2 in a disease or tracating a disease which include aschma, chronic obstructive pulmonary disease (COPD), peripheral or central nervous system disease including neurodegenerative disease, a disorder associated with an including neurodegenerative disease, a disorder associated with an including neurodegenerative disease, is declared is chemic injury, toxin-induced disease, wasting disease, viral infection and osteoporosis; or disorder associated, with decrease in apoptosis, including cancer and inflammatory disorder. With decrease in apoptosis, including cancer and inflammatory disorder. With decrease in apoptosis, including cancer and inflammatory disorder. With decrease in apoptosis, including cancer and inflammatory disorder. With decrease in apoptosis, including cancer and inflammatory disorder. With decrease in apoptosis, including cancer and inflammatory disorder. With decrease in apoptosis, including cancer and inflammatory disorder. Comprising protein phosphatase IIC ABI2 are useful for generating antibodies and for use in various assay systems, and the protein in a two-hybrid assay or three-hybrid assay or three-hybrid assay. The present sequence represents a human protein phosphatase IIC ABI2 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA constructs containing an abscisic acid-associated sequence are used to modulate a response in a plant to abscisic acid so that the plants are protected against any harmful or detrimental effects of stress and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      234 KERIKKCGGFVAWNSLGQPHVNGRLAMTRSIGDLDLKTSGVIAEPETKRIKLHHADDSFL 293

The invention relates to a method for modulating a response in a target plant to abscisic acid (ABA) by introducing a DNA construct comprising an ABA associated sequence operably linked to an early kernel/embryo concernito the plant. The method also involves modulating ABA perception and signal transduction in developing seeds. The method is used to produce plants, particularly cereal plants such as maize, which ave a modified response to ABA so that an increase in yield can be produced. The plants are protected against any harmful/detrimental conditions are protected against any harmful/detrimental is disrupted in a tissue and developmental preferred manner so that sequence is disrupted in a tissue and developmental preferred manner so that conditions. Other plants which can be transformed include rice, cotton, citrus trees, tomatoes, planes, soybean, peanut and olive. The present sequence is Arabidopsis thaliana ABA-insensitive 2 (abi2) mutant. Note: The present sequence is not shown in the specification but is shown in sequence listing of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ----YFAVYDGHGGPAAA 135

The invention relates to a method for modulating a response in a target plant to abscisic acid (ABA) by introducing a DNA construct comprising an ABA-associated sequence operably liked to an early kernel/embryo concer into the plant. The method also involves modulating ABA perception and signal transduction in developing seeds. The method is used to produce plants, particularly ceral plants such as maize, which ave a modified response to ABA so that an increase in yield can be produced. The plants are protected against any harmful/derrimental first structed in a tissue and developmental preferred manner so that female reproductive tissue is innulated from the stress or adverse environmental conditions. Other plants which can be transformed include rice, cotton, citrus trees, tomatoes, pines, soybean, peanut and olive. The present sequence is Arabidopsis thaliana ABA-insenstive I (ABII)

The invention relates to lipid metabolism protein (LMP) nucleic acids and proteins modulating seed storage compound in a plant. The invention also relates to a method for producing a transgenic plant having a modified level of a seed storage compound, which involves transforming a plant cell with an expression vector having LMP. The method is useful for modifying or increasing lipids and fatty acids, cofactors and enzymes in transgenic plants. The present sequence is Arabidopsis thaliana LMP

                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                              셤
```

The invention relates to a method for modulating a response in a target plant to abscisic acid (ABA) by introducing a DNA construct comprising an ABA-associated sequence operably linked to an early kernel/embryo promoter into the plant. The method also involves modulating ABA perception and signal transduction in developing seeds. The method is used to produce plants, particularly cereal plants such as maize, which have a modified response to ABA so that an increase in yield can be produced. The plants are protected against any harmful/detrimental conditions and adverse environmental conditions. The ABA function is disrupted in a tissue and developmental preferred manner so that female reproductive tissue is insulated from the stress or adverse convironmental conditions. Other plants which can be transformed include rice, cotton, citrus trees, tomatoes, pines, soybean, peanut and olive. The present sequence is a Arabidopsis thaliana ABA-insenstive 1 (abil) mutant. Note: The present sequence is not shown in the specification but is derived from ABI protein referred as SED ID NO: 4 (AABC01344) and shown in sequence listing of the specification

Sequence 434 AA;
